

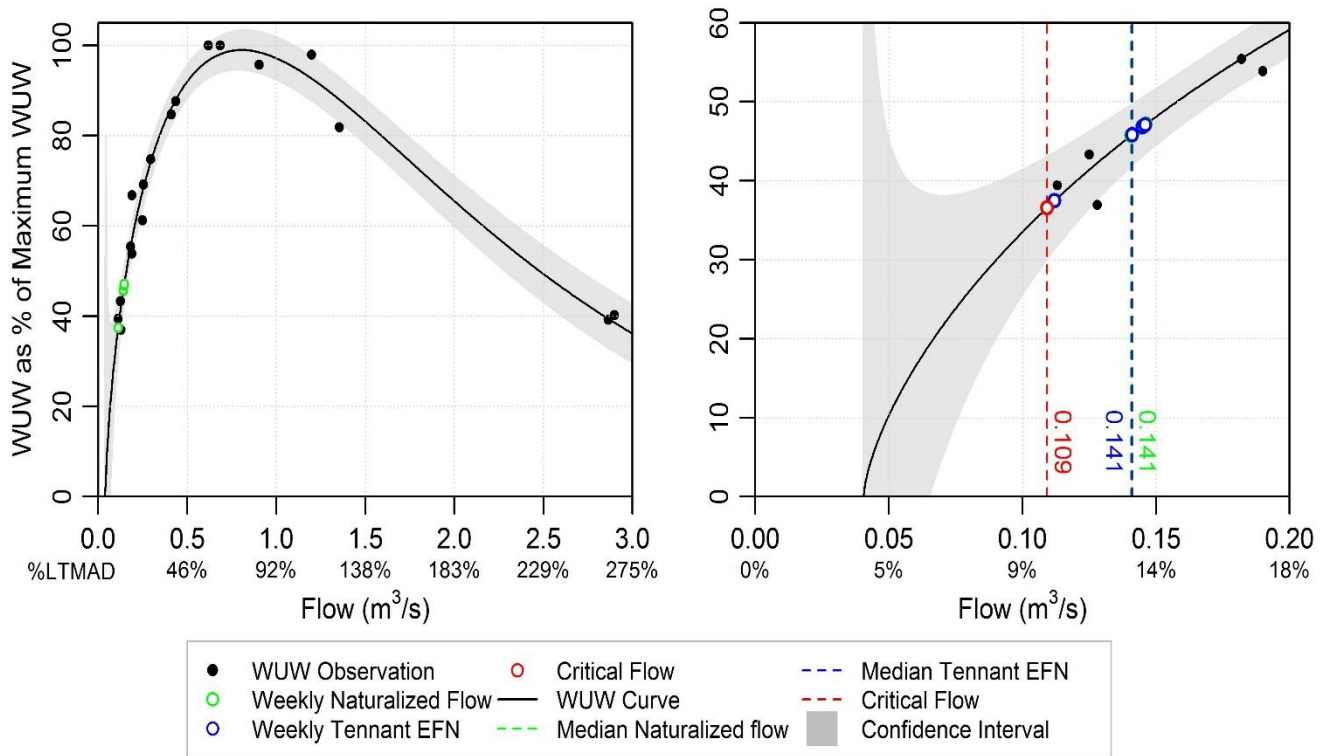

Figure 4-1 provides an example of a WUW versus flow relationship developed using the Okanagan WUW approach, and used to determine EFNs in Whiteman Creek during the kokanee spawning period. This figure appears in Appendix B4 of the Phase 2 report. The graphic on the left shows the WUW versus flow relationship over the full range of measured flows, and the graphic on the right provides an expanded view of the leftmost portion of the curve.

Whiteman Creek Kokanee Spawning WUW

Median values from September 8 to October 5 (week 36-40)
